RE: ART WORK  
BELLEVUE HOSPITAL  
HO-145/MH-1

The sculpture DNA HELIX<sup>2</sup> is the artists translation of the universal life force of the new medicine.

DESCRIPTION  
ANALYSIS:

The sculpture is made up of materials of bronze, stainless steel, copper,

The work is in a sense a continuation of the environment that the occupants work in and in itself exemplifies the mystery that frequently radiates from the pursuit of a problem. The tantalizing quality of the search is embodied in the surface changes, the imagery, and the depth behind the surface illumination.

This sculpture is a tribute to the discovery of the DNA MOLECULE which opens a new era of medical science to mankind. Under the facade of the mystery is the double helix; to the left is the spermatozoa; on the right, the cells and their structure; on the opposite side is the pairing of chromosomes; and the stainless steel reflects the magnitude of the possibilities of a changing biological science and its impact on mankind.
